SUMMARY

Backend engineer with 10+ years in software, working in applied AI since 2022. I've built LLM agents for natural-language database queries, RAG and semantic search systems, speech-to-text pipelines, and computer-vision tools for object detection and OCR. These systems are running in production and are used daily by business teams.

SKILLS

AI / ML: Cloud LLM APIs (OpenAI, Google Gemini), self-hosted LLM inference (llama.cpp), LLM agents, RAG, semantic search, vector databases (pgvector), speech-to-text (whisper.cpp), computer vision (YOLO, OCR), image generation (ComfyUI, Blender), AI coding agents (Claude Code, Hermes Agent)

Backend: Python, FastAPI, Celery, PostgreSQL, MS SQL Server, Redis

Frontend / Mobile: Nuxt.js, TypeScript, Quasar, Flutter

Infrastructure: Docker, Nginx

EXPERIENCE

Fard Systems

Mar 2023 – Sep 2026

Full-Stack Developer

Remote

- Built **Tire Studio**, an internal Photoshop-like tool that turns raw warehouse tire photos into consistent, catalog-ready product images at scale. Designed and implemented both the frontend and backend, combining Blender rendering with AI image-generation pipelines in ComfyUI to produce studio-quality views across an entire tire product line.
- Designed **BTS AI**, a chat-based analytics tool for managers, using field data from a mobile app I also built. Moved visit data into Postgres, added sentiment labels, and built a chat interface that lets managers ask questions like *"which customers complained about pricing?"* instead of digging through spreadsheets and reports.
- Extended the same platform with a RAG-based chat interface for company policies, allowing staff to search warranty procedures, rebate programs, and return rules through natural-language questions instead of manually digging through PDFs.
- Created **CallScribe**, a daily call-analysis pipeline that transcribes customer service calls with whisper.cpp, detects speakers, and corrects industry-specific errors such as tire sizes, prices, and part numbers. It evaluates customer-service agents against the company's training checklist, including responsiveness, product knowledge, and professionalism, and writes the results back to the existing SQL Server database.
- Developed **FS Tire Inventory**, a computer-vision tool that counts tires and reads their labels from a phone video of a warehouse shelf. Trained a custom YOLO detector and used two OCR engines to cross-check the results, with uncertain readings sent for manual review.
- Created an AI service to handle incoming Google reviews: it reads each review, determines the sentiment, and drafts a response. This replaced a daily manual task and freed up the employee who was handling reviews to work on other things.

Earlier Experience

2009 – 2022

WebGostar & Sharif University, Iran

Software developer and later team lead, building enterprise systems (ERP, WMS, HRMS) with Java/Spring Boot on the backend and Nuxt.js on the frontend, before shifting focus to AI and full-stack development in 2022.

EDUCATION

Bachelor of Software Engineering

2004 – 2008

Iran
