SUMMARY

Full-stack AI engineer with 15+ years who turns slow manual work into production AI systems. Since 2022, has shipped LLM agents, RAG, speech-to-text, and computer-vision tools used daily by business teams: tire counts cut from a full night to minutes, 100+ calls a day scored automatically, and paper forms replaced across 9 departments. Stack: Python/FastAPI, Nuxt.js, Flutter.

SKILLS

AI / ML: LLM agents and multi-agent systems (triage and routing), tool calling, prompt engineering, structured outputs, RAG (hybrid search, reranking), LLM evaluation (LLM-as-a-judge, LangSmith) and guardrails, vision-language models (Qwen3-VL, PaddleOCR-VL), computer vision (YOLO fine-tuning, SAM 3, OpenCV), speech-to-text and speaker diarization (whisper.cpp), image generation and editing (ComfyUI with LoRAs, FLUX, Qwen Image Edit), self-hosted LLMs (llama.cpp, Qwen, Gemma, DeepSeek), OpenAI, Claude, and Gemini APIs, Hugging Face, PyTorch, LangChain, LangGraph, AI coding agents (Claude Code)

Backend: Python, FastAPI, Node.js, REST APIs, WebSockets, Celery, Java/Spring Boot

Frontend: Nuxt.js, Vue.js, TypeScript, Quasar, state management (Pinia), SSR/SSG, responsive and mobile-first UI, REST and WebSocket integration

Mobile: Flutter / Dart (cross-platform iOS, Android, desktop), state management (Provider), offline-first apps with background sync, native device features (camera, GPS, audio recording, barcode scanning), widget and unit testing, Android TV, App Store and Google Play releases with code signing

Data: PostgreSQL, MySQL, MS SQL Server, MongoDB, Redis, vector databases (pgvector, Chroma, Qdrant), Power BI, Tableau

Infrastructure: Docker, Linux, Nginx, CI/CD (GitHub Actions), AWS (EC2, S3, App Runner), GCP

EXPERIENCE

Healthcare Data Consultant (Part-time), CTN Health *Oct 2026 – Present*

- Turn HL7 and FHIR records from EHR systems into charts and decision tables that help physicians make clinical decisions faster, under HIPAA rules.

Full-Stack AI Developer, Fard Systems *Mar 2023 – Sep 2026*

- **Produced a full brand catalog (150 to 200 images: every size in 3 angles) from just 2 photos in 15 to 30 minutes, replacing studio photography,** by designing and building an AI image studio (Nuxt, Python). It groups look-alike sizes with geometric clustering, cutting render work almost in half, fits each size's true shape with Blender, cleans and retouches tread and sidewall with masked AI editing (ComfyUI with LoRAs, FLUX, Qwen Image Edit, Nano Banana), and auto-places each size's label.
- **Replaced paper forms for 20 to 30 daily users across 9 departments** (sales, HR, purchasing, regional managers) by designing, building, and launching a Flutter app for iOS, Android, and desktop, live on the App Store and Google Play. Each team's questions and branching come from the database, so flows change without a new release. Works fully offline with safe sync, captures photos, voice notes, signatures, and GPS-ranked nearby stores, and feeds its data into BTS AI analytics.
- **Scored 100+ customer-service calls a day automatically, giving managers their first view of call quality,** with a daily pipeline that transcribes on-premise (whisper.cpp), labels speakers, and checks each call against an 11-point checklist.
- **Replaced spreadsheet digging with plain-English answers for ~20 managers and staff** by building a multi-agent LLM system (a triage agent routes each question to specialist agents, a response agent writes the answer) that returns tables and charts from PostgreSQL, plus a RAG assistant over ~260 policy and pricing PDFs with cited sources and guardrails.
- **Cut warehouse tire counting from a full night to a few minutes, with near-100% accuracy in testing,** by building a computer-vision tool: a fine-tuned YOLO model plus two cross-checking OCR engines, with human review for low-confidence reads.
- **Kept sensitive company data in-house for AI features** by standing up a private NVIDIA L4 GPU server for open-source LLMs and speech-to-text (llama.cpp, whisper.cpp) behind an OpenAI-compatible API, with Docker Compose and Nginx.
- **Moved a company's entire project workflow into one system used daily by 50+ staff** with an internal Vue/Nuxt tool for cost tracking, approvals, and billing, with role-based permissions, audit history, and Monday.com sync.
- **Put the caller's CRM record on the agent's screen the moment a call rings** (WebSocket, Windows app, GitHub Actions).

EARLIER EXPERIENCE (2009 – 2022)

- **Team Lead, WebGostar (startup), 2020 – 2022:** Led 5 developers (Agile/Scrum, code reviews, mentoring) on an ERP system for accounting, CRM, and procurement; built Kafka-to-HDFS ETL pipelines.
- **Software Designer and Developer, WebGostar (startup), 2012 – 2020:** Built Java Spring Boot REST APIs for a Vue.js web app and a warehouse system with a Flutter barcode app, on AWS (EC2, S3, RDS, Lambda).
- **Software Engineer, Sharif University, 2009 – 2012:** Developed an HR and attendance system.

EDUCATION

B.S. in Software Engineering, Payam University *2009*
