SUMMARY

Full-stack AI engineer with 15+ years of experience across backend, databases, web, mobile, and deployment. Applied AI work since 2022 includes LLM agents, RAG and semantic search, speech-to-text pipelines, and computer vision. Core stack: Python/FastAPI, Nuxt.js, and Flutter.

SKILLS

AI / ML: LLM agents (LangChain, LangGraph), RAG, semantic search, pgvector, speech-to-text (whisper.cpp), computer vision (YOLO, OCR), image generation (ComfyUI), OpenAI and Gemini APIs, self-hosted inference (llama.cpp), PyTorch, AI coding agents (Claude Code)

Backend: Python, FastAPI, Node.js, REST APIs, WebSockets, Celery, Java/Spring Boot

Frontend / Mobile: Nuxt.js, Vue.js, TypeScript, Flutter (iOS, Android)

Data: PostgreSQL, MS SQL Server, Redis, Power BI, Tableau

Infrastructure: Docker, Linux, Nginx, CI/CD (GitHub Actions), AWS, GCP

EXPERIENCE

Data Scientist, CTN Health (Remote, USA) *Oct 2026 – Present*

- Parse HL7 and FHIR healthcare records, extract the data the company's clinical rules call for, and turn it into charts, tables, and decision tables that physicians can read at a glance.

Full-Stack AI Developer, Fard Systems (Remote, USA) *Mar 2023 – Sep 2026*

- **Tire Studio (AI product-image tool)**: Built the whole tool, web frontend (Nuxt) and Python backend, that turns raw warehouse tire photos into catalog-ready product images using Blender 3D rendering and ComfyUI image generation. Before this, images needed a studio photographer and manual retouching, and many brands had no photo or one photo shared across all sizes. Now every brand and size has its own image from three angles (front, sidewall, 45°), ready for the catalog and online stores.
- **BTS AI (chat-based analytics for a tire distributor client)**: Built an LLM assistant that lets managers ask questions about field-visit data in plain English and get back tables, charts, and flowcharts, so they no longer dig through spreadsheets. Moved the visit records into PostgreSQL and added automatic sentiment labels on visit notes. Added a second assistant (RAG) that answers from about 260 internal policy and pricing PDFs and shows its sources, plus a safety check that screens each question before it runs.
- **BTS Notes (field-notes mobile app)**: Designed, built, and launched a Flutter app for iOS, Android, and desktop that 20 to 30 employees in nine departments (sales, HR, purchasing, regional managers, and others) use every day to record their work. It replaced paper forms that were almost never reviewed. Works fully offline and syncs on its own when the connection comes back. Questions are loaded from the database, so a team can add or change them without a new app release. Handled all releases, including code signing and App Store and Google Play submissions.
- **CallScribe (call-quality analysis)**: Built a pipeline that runs every day, transcribes customer-service calls on the company's own hardware with whisper.cpp, labels who is speaking (agent, customer, IVR phone menu, or voicemail), and fixes industry terms such as tire sizes. Scores each call against the company's 11-point training checklist and saves the results to the existing SQL Server database. Call recordings had never been reviewed before, so this gave managers their first real view of call quality, including calls dropped at the IVR and calls that were not about work.
- **FS Tire Inventory (tire counting with computer vision)**: Developed a tool that counts tires and reads the brand and size from their labels using a phone video of a warehouse rack. Uses a custom-trained YOLO detector and two OCR engines that check each other, and sends unsure readings to a person for review. Counting used to take staff a full night by hand, with frequent mistakes. Now it takes a few minutes.
- **AGM Office (project-management system)**: Built an internal tool for cost tracking, approvals, and billing, with role-based permissions, a full change history, and links to Monday.com and the company's online store.
- **FS Phone Screen (CRM pop-up for incoming calls)**: Built a tool that shows a customer's CRM record on the agent's screen the moment that customer calls. The backend sends the signal over WebSocket to a small Windows desktop app, and GitHub Actions builds and packages the installer automatically.
- **Telegram ordering bot**: Developed a Telegram bot that lets B2B customers search tire inventory from any chat window and place orders. New customers sign up through an approval step, then add items to a cart that runs on stored procedures in the company's SQL Server database.
- **Google review replies**: Created an AI service that reads new Google reviews, sorts them by sentiment, and drafts a fitting reply for each one. This took over a task that used to cost one employee hours of writing.
- **Fard Systems TV**: Developed a Flutter kiosk app for Android TV, with content controlled remotely for each device.

Team Lead, WebGostar (startup) *2020 – 2022*

- Led a team of 5 developers on an ERP system covering accounting, project management, CRM, and procurement. Planned how data from different sources moves into HDFS through Apache Kafka.

Software Designer, WebGostar (startup) *2017 – 2020*

- Worked on a warehouse management system in Java, with a Flutter mobile app for barcode-based receiving and cycle counting. Used AWS (EC2, S3, RDS, Lambda).

Software Developer, WebGostar (startup) *2012 – 2017*

- Built REST APIs with Java Spring Boot for a Vue.js web app, on relational and NoSQL databases.

Software Engineer, Sharif University *2009 – 2012*

- Developed an HR and attendance system in Java.

EDUCATION

Bachelor of Software Engineering *2004 – 2008*
